The BradyLab/IGGPIPE GitHub repository contains code and documentation for the software package called **IGGPIPE** (**IGG Pipeline**).

**IGGPIPE** analyzes two or more genomes for length-polymorphic regions bounded by unique sequences and designs PCR primers within these sequences. The primers can be used to amplify the region from genomic DNA of any of the species used to create the markers, and the amplicon size will indicate which species the DNA came from - an **IGG** marker.

**IGG** stands for *Indel Group in Genomes*.

## 1. Download, Installation, and Running

### 1.1. Requirements

- The installation instructions are for 64-bit Mac OSX. It has also been tested on 64-bit Linux. It will not work on 32-bit Windows. It has not been tested on 64-bit Windows.

### 1.2. Download IGGPIPE files

1. Browse to <https://github.com/BradyLab/IGGPIPE>
2. At bottom of right column on screen, click "Download ZIP" and choose a place to put it on your computer.
3. Unzip the zip file on your computer.
4. Rename the unzipped folder from "IGGPIPE-master" to just "IGGPIPE".

### 1.3. Install IGGPIPE

- Look inside the downloaded IGGPIPE folder on your computer for file INSTALL.pdf or INSTALL.html and open either one and follow the instructions.

## 1.4. Run IGGPIPE to generate markers after installation

- Find file RUN.pdf or RUN.html in the IGGPIPE folder on your computer and open either one and follow the instructions.

## 1.5. For problems and help:

- Post an issue on GitHub under BradyLab/IGGPIPE repository
- Contact me, Ted Toal, [twtoal@ucdavis.edu](mailto:twtoal@ucdavis.edu) [<mailto:twtoal@ucdavis.edu>]
